

Metal Stamping Seminar

Res Manufacturing Company has created a "Metal Stamping Seminar" to help improve design for manufacturability, functionality, and cost containment. The primary objective of Res' Stamping Seminar is to provide a basic understanding of metal stamping processes, material characteristics and design considerations to allow the most effective procurement of stamped metal components and assemblies.

Included in the seminar are sections on:

- Basic Press Types
- Stamping and Post-Stamping Processes
- Types of Production Tools
- Material Selection
- Pre-Design Considerations and Stamped Part Characteristics
- Guidelines for Blanking, Piercing and Forming
- Dimensioning for Success
- Part Inspection
- Packaging

The discussion is facilitated by Res Manufacturing associates and often supported by guest speakers from related industries. The material is based on best-in-class industry standards published by the Precision Metal Forming Association (PMA). Samples, videos and open discussions are used to enhance the learning experience. The daylong event is held off site and is culminated with a tour of Res' production facility. The tour gives the attendees an opportunity to see much of the discussion topics first hand.

The one-day seminar is generally held in Milwaukee in June of every other year. Look for the next announcement in Spring, 2011. It will prove to be a valuable learning session for members of purchasing, engineering, manufacturing and sales alike. The course materials are yours to keep and should prove valuable for future reference. The seminars traditionally include lunch and beverages.

Ask us about our on-site seminar presentations. If you would like Res associates to present the seminar at your facility, please contact Rachael at the phone number below.
